## 1. Automated AI Triage & Disease Severity

|                         |                                                                                                   |
|-------------------------|---------------------------------------------------------------------------------------------------|
| Predicted ICDR Grade:   | Level 3 — Severe Non-Proliferative DR                                                             |
| Referable DR Status:    | REFERABLE (Level 2+)                                                                              |
| Calibrated Confidence:  | 26.5% (Temperature scaled, T=1.25)                                                                |
| Clinical Triage Action: | URGENT REFERRAL: Severe NPDR (4-2-1 clinical criteria reached). Specialist review within 2 weeks. |

## 2. Annotated Retinal Findings & Evidence Overlays

- Microaneurysms: 72 detected (Red dots)
- Hard Exudates: 0.01% retinal surface (Yellow contours)
- Soft Exudates (Cotton Wool): None (Cyan)
- Hemorrhages: 55 lesions (Magenta contours)
- Macular / Foveal Threat: Safe (>1 DD clearance)
- Vessel Density: 1.8% of retinal field

Evidence Consistency: PARTIALLY\_SUPPORTED  
Concordance Index: 0.34  
Pointing Game Hit: YES

|                                    |                                                                                                                             |
